

Lecture Three

The Relational Model

Based on Chapter Three of this book:

**Database Systems: A Practical Approach
to Design, Implementation and
Management**

International Computer Science S.

Carolyn Begg, Thomas Connolly

Lecture 3 - Objectives

- Terminology of relational model.
- How tables are used to represent data.
- Connection between mathematical relations and relations in the relational model.
- Properties of database relations.
- How to identify candidate, primary, and foreign keys.
- Meaning of entity integrity and referential integrity.
- Purpose and advantages of views.

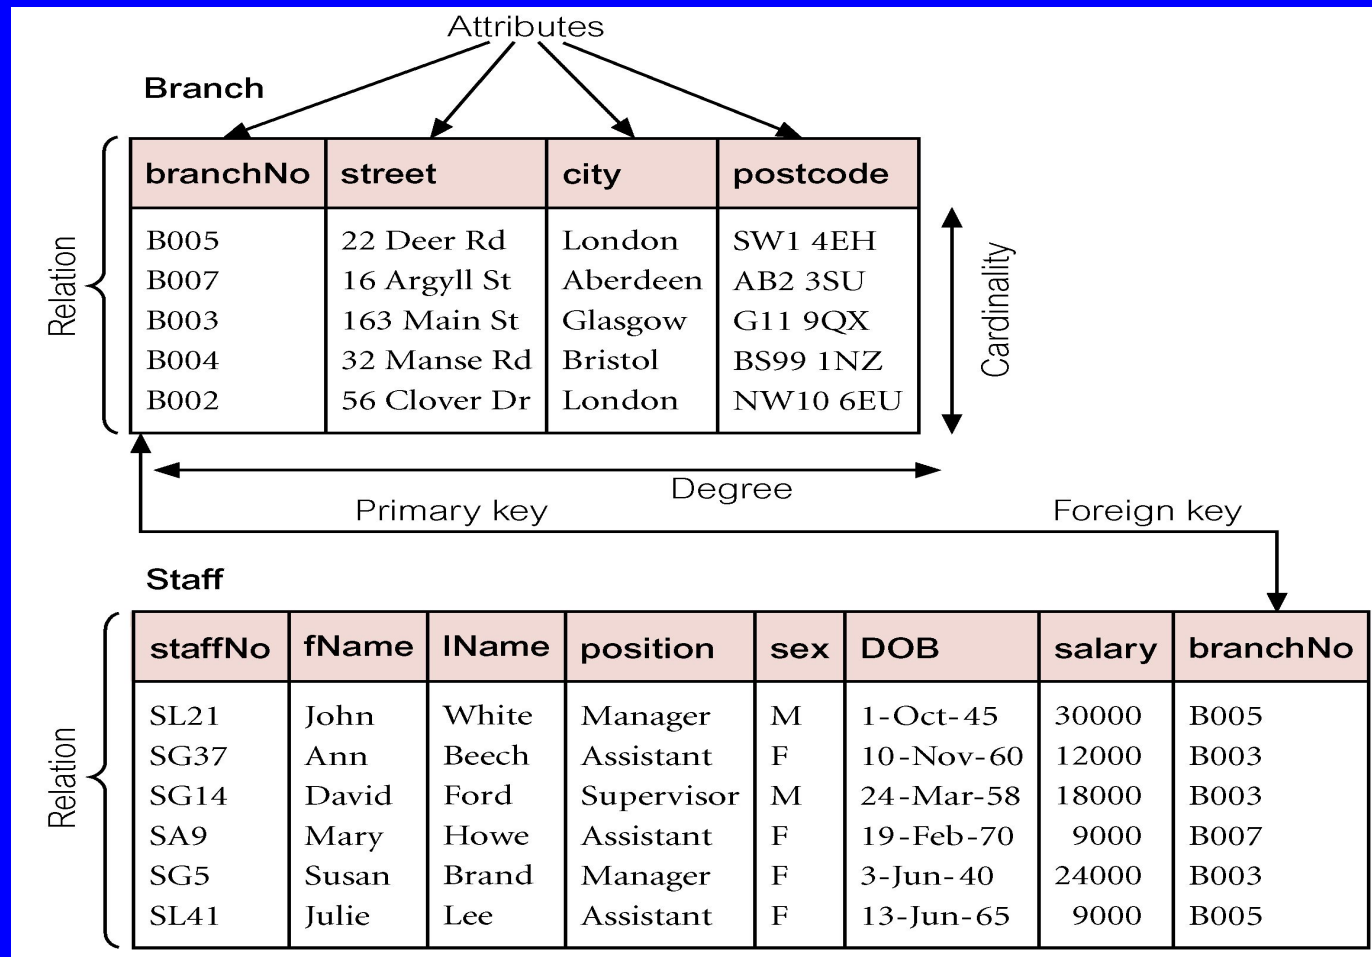

Relational Model Terminology

- A relation is a table with columns and rows.
 - Only applies to logical structure of the database, not the physical structure.
- Attribute is a named column of a relation.
- Domain is the set of allowable values for one or more attributes.

Relational Model Terminology

- **Tuple is a row of a relation.**
- **Degree is the number of attributes in a relation.**
- **Cardinality is the number of tuples in a relation.**
- **Relational Database is a collection of normalized relations with distinct relation names.**

Instances of Branch and Staff (part) Relations

Examples of Attribute Domains

Attribute	Domain Name	Meaning	Domain Definition
branchNo	BranchNumbers	The set of all possible branch numbers	character: size 4, range B001–B999
street	StreetNames	The set of all street names in Britain	character: size 25
city	CityNames	The set of all city names in Britain	character: size 15
postcode	Postcodes	The set of all postcodes in Britain	character: size 8
sex	Sex	The sex of a person	character: size 1, value M or F
DOB	DatesOfBirth	Possible values of staff birth dates	date, range from 1-Jan-20, format dd-mmm-yy
salary	Salaries	Possible values of staff salaries	monetary: 7 digits, range 6000.00–40000.00

Alternative Terminology for Relational Model

Table 3.1 Alternative terminology for relational model terms.

Formal terms	Alternative 1	Alternative 2
Relation	Table	File
Tuple	Row	Record
Attribute	Column	Field

Database Relations

- **Relation schema**
 - **Named relation defined by a set of attribute and domain name pairs.**
- **Relational database schema**
 - **Set of relation schemas, each with a distinct name.**

Properties of Relations

- **Relation name is distinct from all other relation names in relational schema.**
- **Each cell of relation contains exactly one atomic (single) value.**
- **Each attribute has a distinct name.**
- **Values of an attribute are all from the same domain.**

Properties of Relations

- Each tuple is distinct; there are no duplicate tuples.
- Order of attributes has no significance.
- Order of tuples has no significance, theoretically.

Relational Keys

- **Superkey**
 - An attribute, or a set of attributes, that uniquely identifies a tuple within a relation.
- **Candidate Key**
 - Superkey (K) such that no proper subset is a superkey within the relation.
 - In each tuple of R, values of K uniquely identify that tuple (uniqueness).
 - No proper subset of K has the uniqueness property (irreducibility).

Relational Keys

- **Primary Key**
 - Candidate key selected to identify tuples uniquely within relation.
- **Alternate Keys**
 - Candidate keys that are not selected to be primary key.
- **Foreign Key**
 - Attribute, or set of attributes, within one relation that matches candidate key of some (possibly same) relation.

Relational Integrity

- **Null**
 - Represents value for an attribute that is currently unknown or not applicable for tuple
 - Deals with incomplete or exceptional data.
 - Represents the absence of a value and is not the same as zero or spaces, which are values.

Relational Integrity

- **Entity Integrity**
 - In a base relation, no attribute of a primary key can be null.
- **Referential Integrity**
 - If foreign key exists in a relation, either foreign key value must match a candidate key value of some tuple in its home relation or foreign key value must be wholly null.

Relational Integrity

- **Enterprise Constraints**
 - **Additional rules specified by users or database administrators.**

Views

- **Base Relation**
 - **Named relation corresponding to an entity in conceptual schema, whose tuples are physically stored in database.**
- **View**
 - **Dynamic result of one or more relational operations operating on base relations to produce another relation.**

Views

- **A virtual relation that does not necessarily actually exist in the database but is produced upon request, at time of request.**
- **Contents of a view are defined as a query on one or more base relations.**
- **Views are dynamic, meaning that changes made to base relations that affect view attributes are immediately reflected in the view.**

Purpose of Views

- Provides powerful and flexible security mechanism by hiding parts of database from certain users.
- Permits users to access data in a customized way, so that same data can be seen by different users in different ways, at same time.
- Can simplify complex operations on base relations.

Updating Views

- All updates to a base relation should be immediately reflected in all views that reference that base relation.
- If view is updated, underlying base relation should reflect change.

Updating Views

- **There are restrictions on types of modifications that can be made through views:**
 - **Updates are allowed if query involves a single base relation and contains a candidate key of base relation.**
 - **Updates are not allowed involving multiple base relations.**
 - **Updates are not allowed involving aggregation or grouping operations.**

Updating Views

- **Classes of views are defined as:**
 - **theoretically not updateable**
 - **theoretically updateable**
 - **partially updateable.**
